

DEEP LEARNING-BASED PART-OF-SPEECH TAGGING OF THE ETHIOPIC-LANGUAGE

BY: SENAIT GEBREMICHAEL TEFAGERGISH

SUPERVISOR: JURGITA KAPUCIUTE DZIKIENE

RESEARCH OBJECTIVE

- ▶ Part-of-Speech tagger is a prerequisite for many NLP applications
- ▶ Tigrinya is
 - ▶ morphologically rich,
 - ▶ low- resource language
- ▶ POS tagging for Tigrinya:
 - ▶ Limited resources (Keleta et al.,2016)
 - ▶ Solved with traditional ML approaches (Teklay Gebregzabiher Abreha, 2010; Keleta et al., 2016)

INTRODUCTION

GOALS

- ▶ Solve POS tagging task with the state-of-the-art (i.e., deep learning) approaches

TASKS

- Related Research Analysis
- Data Preparation
- Experiment with different approaches (classifiers and vectorization type)
- Manual and automatic tuning of hyper-parameters
- Recommendation formulation

Scientific novelty:

- ▶ POS tagging task for Tigrinya has never been solved before using Deep Neural Networks and neural word embeddings

Practical value:

- ▶ Part-of-Speech tagger could be used for many NLP applications

TIGRINYA AND ITS MORPHOLOGY

- ▶ Belongs to the Semitic language- Afro-Asiatic family:
Hebrew, Amharic, Maltese, Tigre and Arabic
- ▶ Characterized by rich derivational and influential morphology.
- ▶ Distinguishing feature lies in the ‘root-template’ morphological pattern that is often composed of triliteral roots.
- ▶ Ge’ez script is adapted to write other mostly Semitic languages, Particularly Amharic and Tigrinya.

Token: እንተዘይሓተትካዮ ‘IntezeyHatetIkayo’
Gloss: if you did not ask him

Word order: if not asked you him

Morphology:

Category: VERB

Sub Category: REL NEG TAM: perf.

Clitics: CON

Attributes: SUBJ.PRO.1st, Sg, M OBJ. PRO. 3rd,Sg,M

Stem: Hatetl (CaCeCI) Root: Htt

POS: V_PRF_C(Perfective Verb with Conjugation)

THE CORPORA

- ▶ Nagaoka Tigrinya Corpus (Keleta et al., 2016) is the only Corpus available publicly.
- ▶ Consists of:
 - ▶ 72,080 tokens
 - ▶ 4656 sentences.
 - ▶ 20 types of POS tags: V_PRF, UNC, V_AUX, V_IMV, N, PUN, V_REL, ADV, INT, N_V, ADJ, NUM, N_PRP, FW, V, V_GER, CON, V_IMF, PRE, PRO

► Nagaoka Tigrinya Corpus Snippet and its class distribution

VECTORIZATION

Word Embedding

- ▶ DNN applied on a top of the vectorized words.
- ▶ Words represented with real values vector
- ▶ Similar words are projected closer in vector space.
- ▶ Word2Vec approach is used in this experiment
- ▶ Window size equal to 3 and with 100 dimensions.
- ▶ Pre-trained word embeddings saved and afterwards used in all the experiments.

EXPERIMENTAL SETUP

Evaluation metrics

► Accuracy = $\frac{tp+tn}{tp+tn+fp+fn}$

where, tp (true positive)

tn (true negatives)

fn (false negatives)

fp (false negatives)

► Loss = $-\sum_{c=1}^M Y_{o,c} \log \log(p_{o,c})$

Where, M is number of classes (POS tags)

Y is binary indicator (0,1) if class label c is the correct classification for observation o

P is a predicted probability of observation o in class c

EXPERIMENTAL SETUP

Baselines

- ▶ Random baseline = $\sum P(c_i)^2 = 0.127821$
- ▶ Majority baseline = $\max P(c_i) = 0.270475$

Statistical significance measure:

- ▶ McNemar(1945) test with significance level =95%

EXPERIMENTAL SETUP

Tools

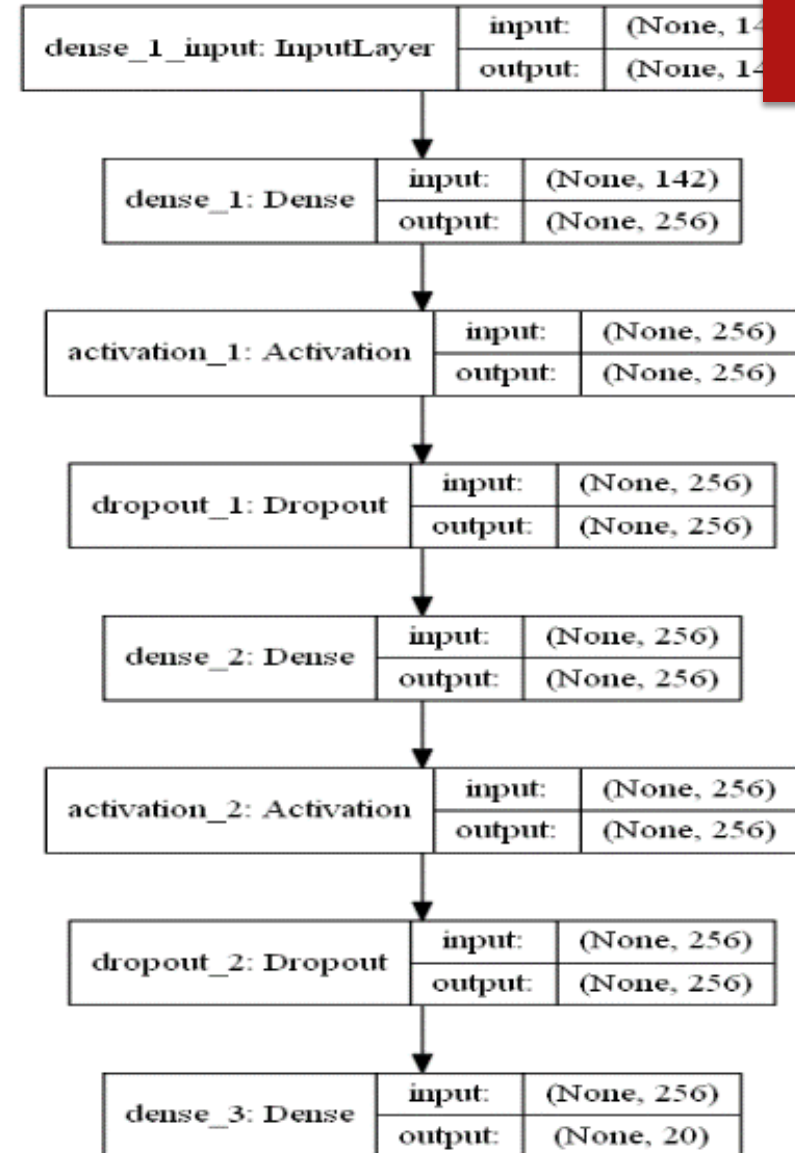

- ▶ Python programming language, TensorFlow, Keras, Hyperas
- ▶ Tested methods:
 - ▶ FFNN-Feed Forward Neural Network
 - ▶ CNN- Convolutional Neural Network
 - ▶ LSTM- Long Short Term Memory
 - ▶ BiLSTM – Bidirectional LSTM
- ▶ Tested hyper-parameters:
 - ▶ Activation function
 - ▶ Epochs
 - ▶ Batch sizes

EXPERIMENTAL SETUP

- ▶ Hyper- parameter tuning approaches:
 - ▶ Manual hyper-parameter tuning
 - ▶ Automatic hyper-parameter tuning
- ▶ Manual tuning: 80% of dataset for training ; 20% for testing
- ▶ Automatic tuning: 80% for training (of which 20% for validation); 20% for testing

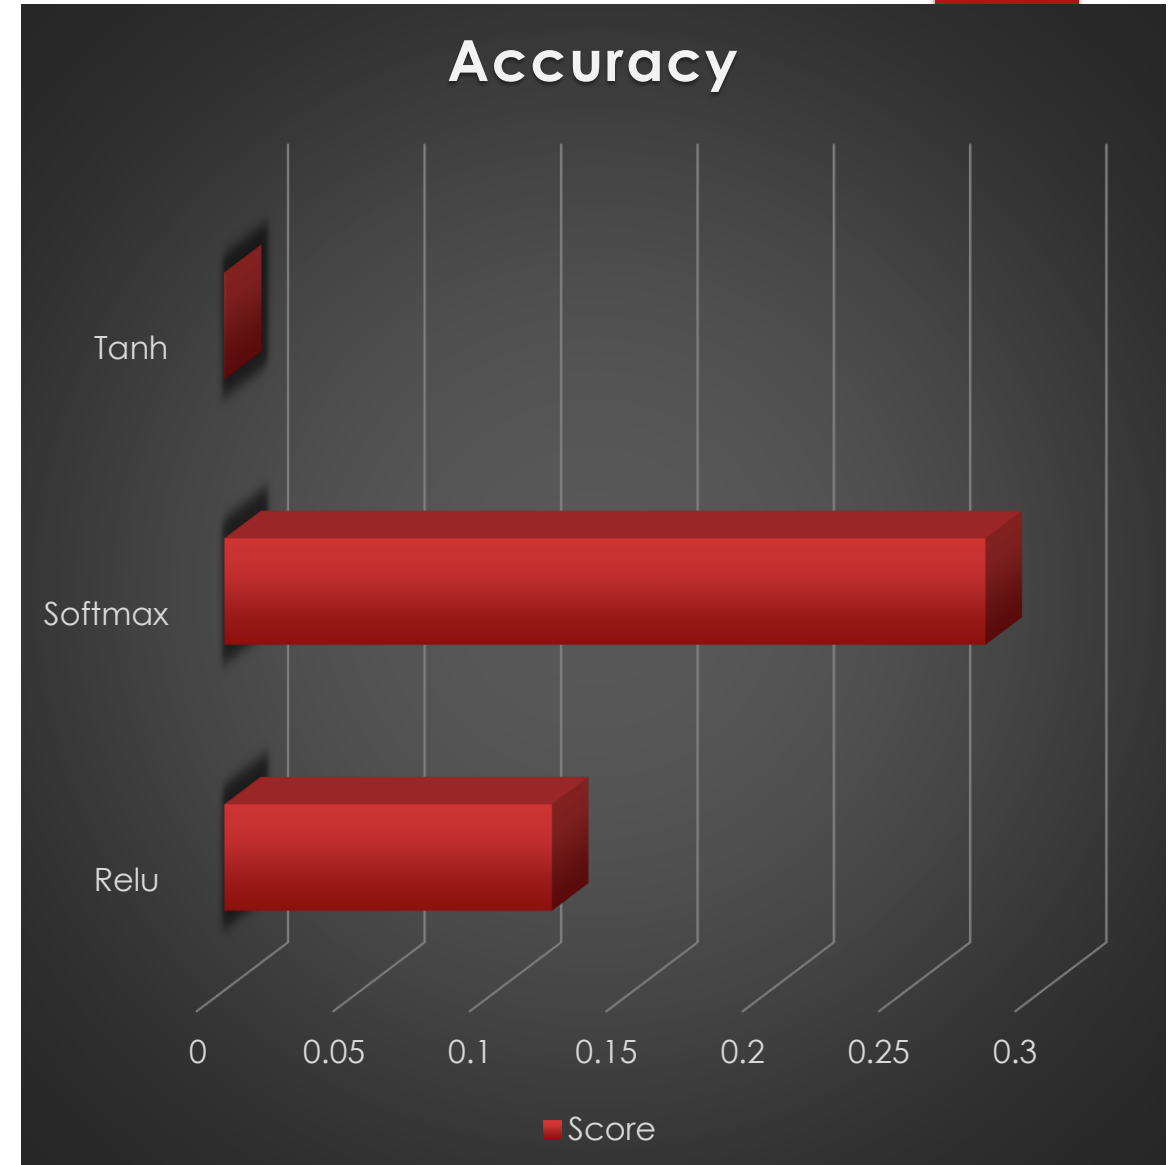

FFNN

- ▶ Tuning type: manually
- ▶ Vectorization : One-hot encoding
- ▶ Hyper-parameters:
 - ▶ Up to 3 hidden layers
 - ▶ of neurons of 256, 512, 1024
 - ▶ Epochs =100
 - ▶ Batch_size = 256

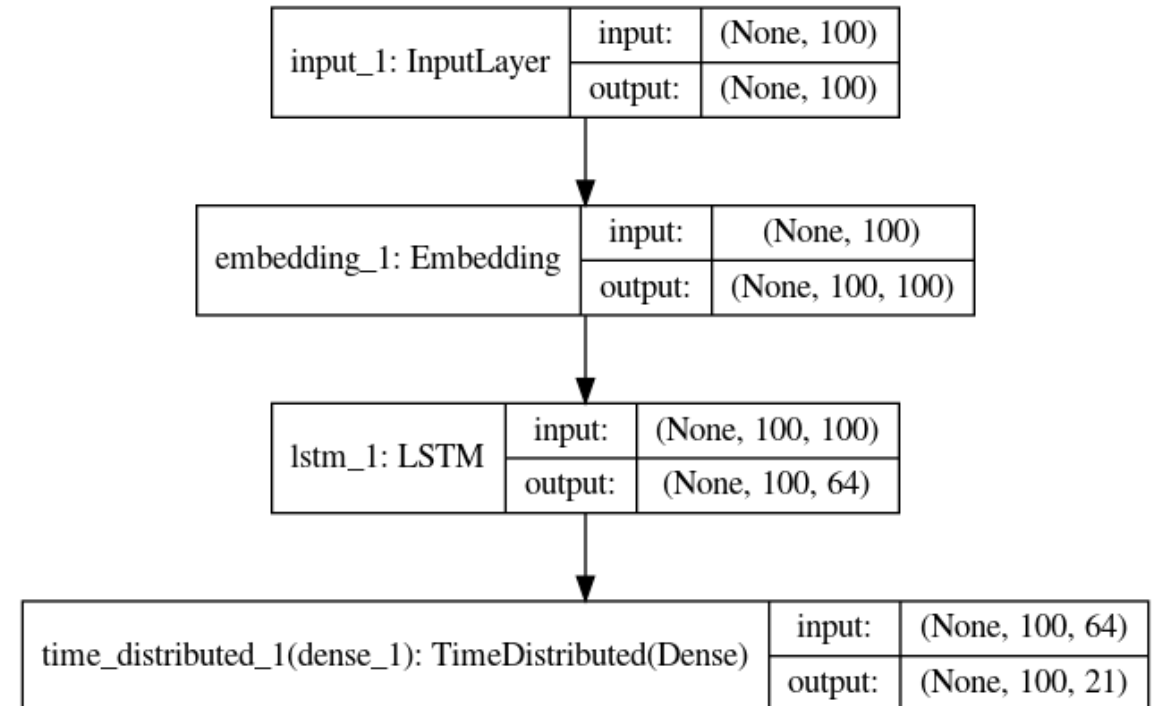

FFNN RESULTS

- ▶ 28% of accuracy
- ▶ Softmax Activation function
- ▶ Different Hidden layers and neurons didn't show any significant impact on the accuracy

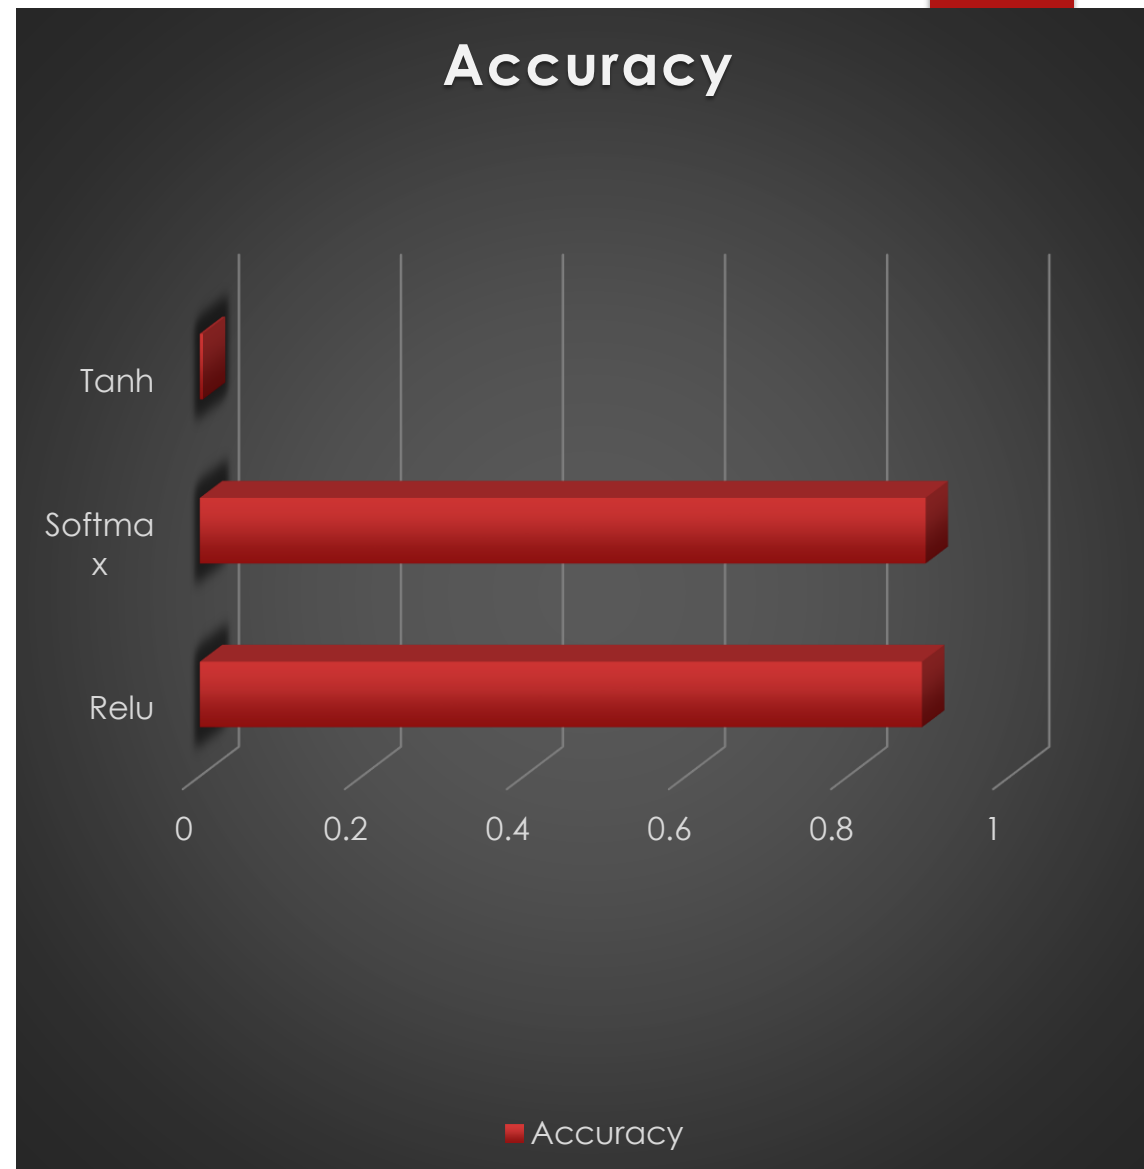

LSTM

- ▶ Training type : manually
- ▶ Vectorization : neural word embeddings
- ▶ Hyper-parameters:
 - ▶ Epochs = 100
 - ▶ Batch_size = 32

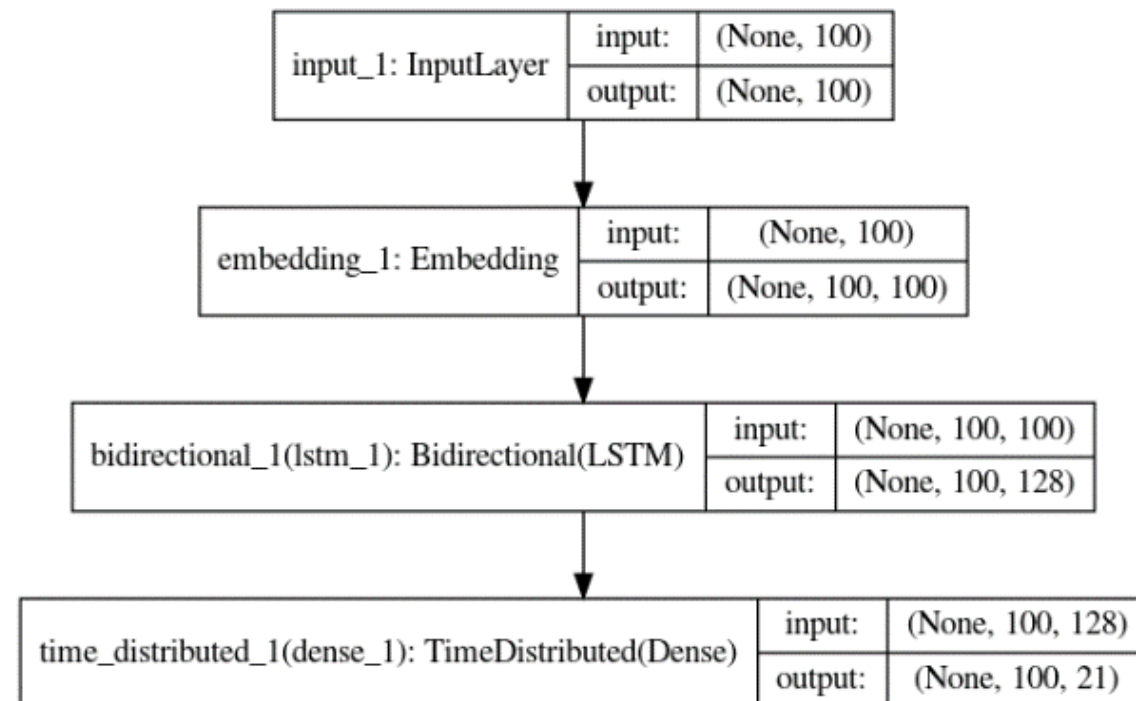

LSTM RESULTS

- ▶ 89% of accuracy
- ▶ Softmax Activation Function
- ▶ Optimizer = rmsprop
- ▶ 1 layer
- ▶ 64 neurons

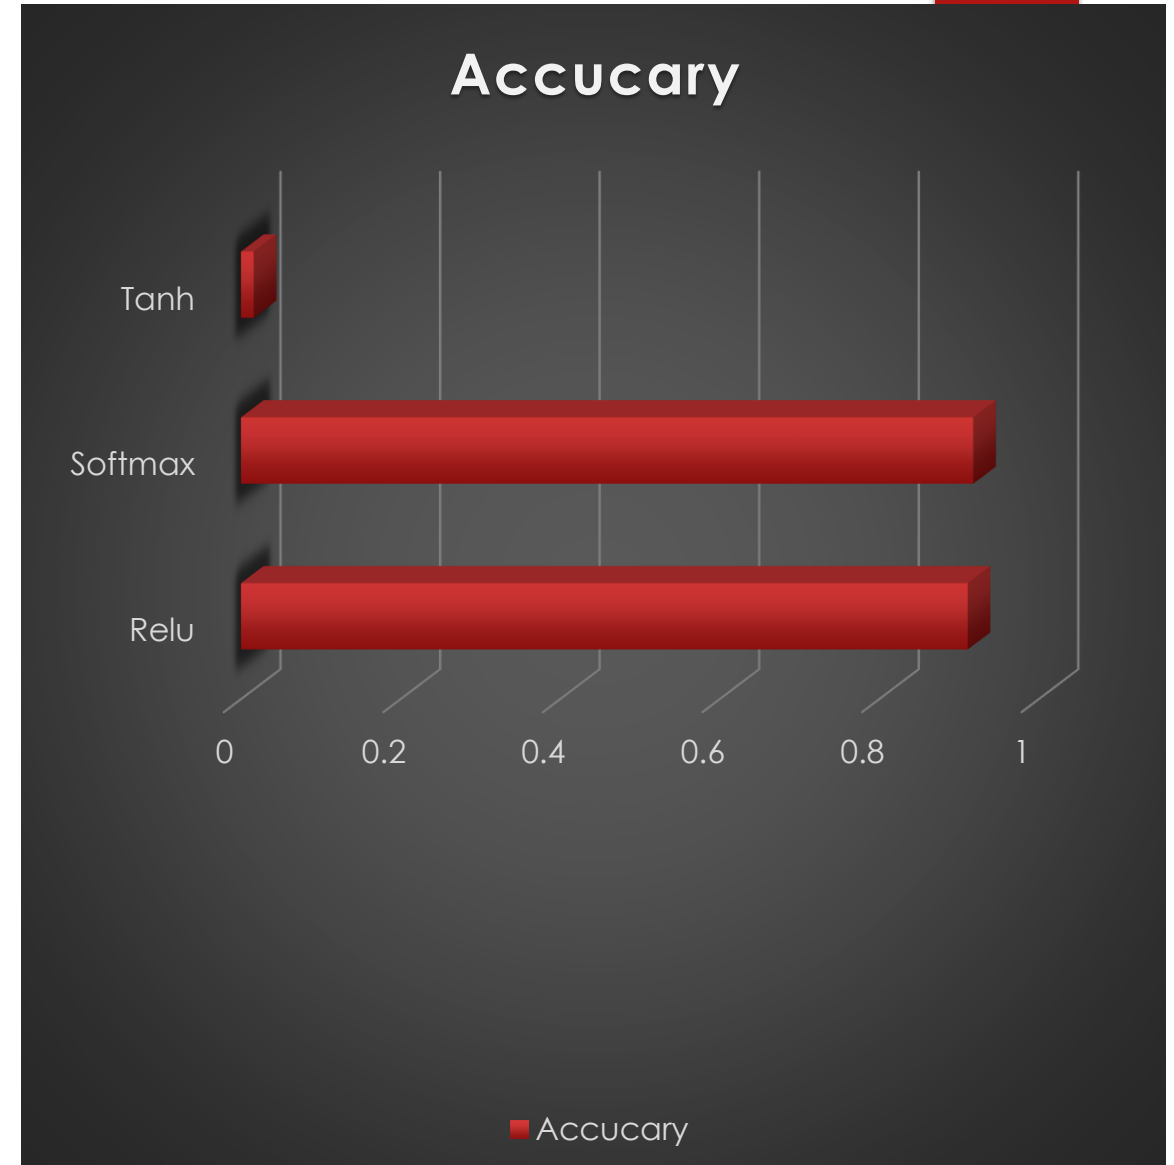

BiLSTM

- ▶ Tuning type : manually
- ▶ Vectorization : neural word embeddings
- ▶ Hyper-parameters:
 - ▶ Epochs = 100
 - ▶ Batch_size 32

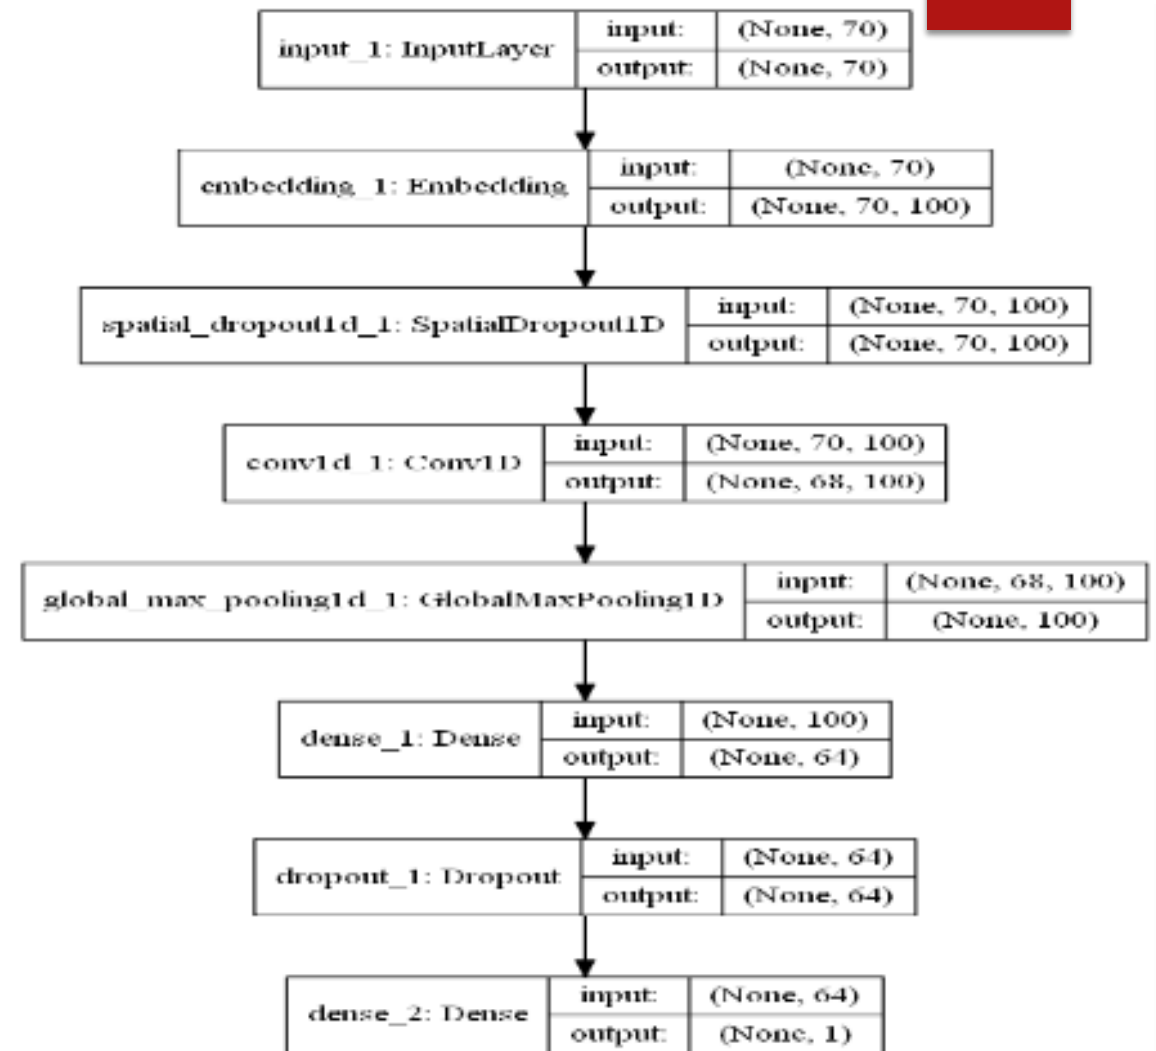

BiLSTM RESULTS

- ▶ Best accuracy achieved using the Softmax Activation function that is 91%
- ▶ 1 layer
- ▶ 128 neurons

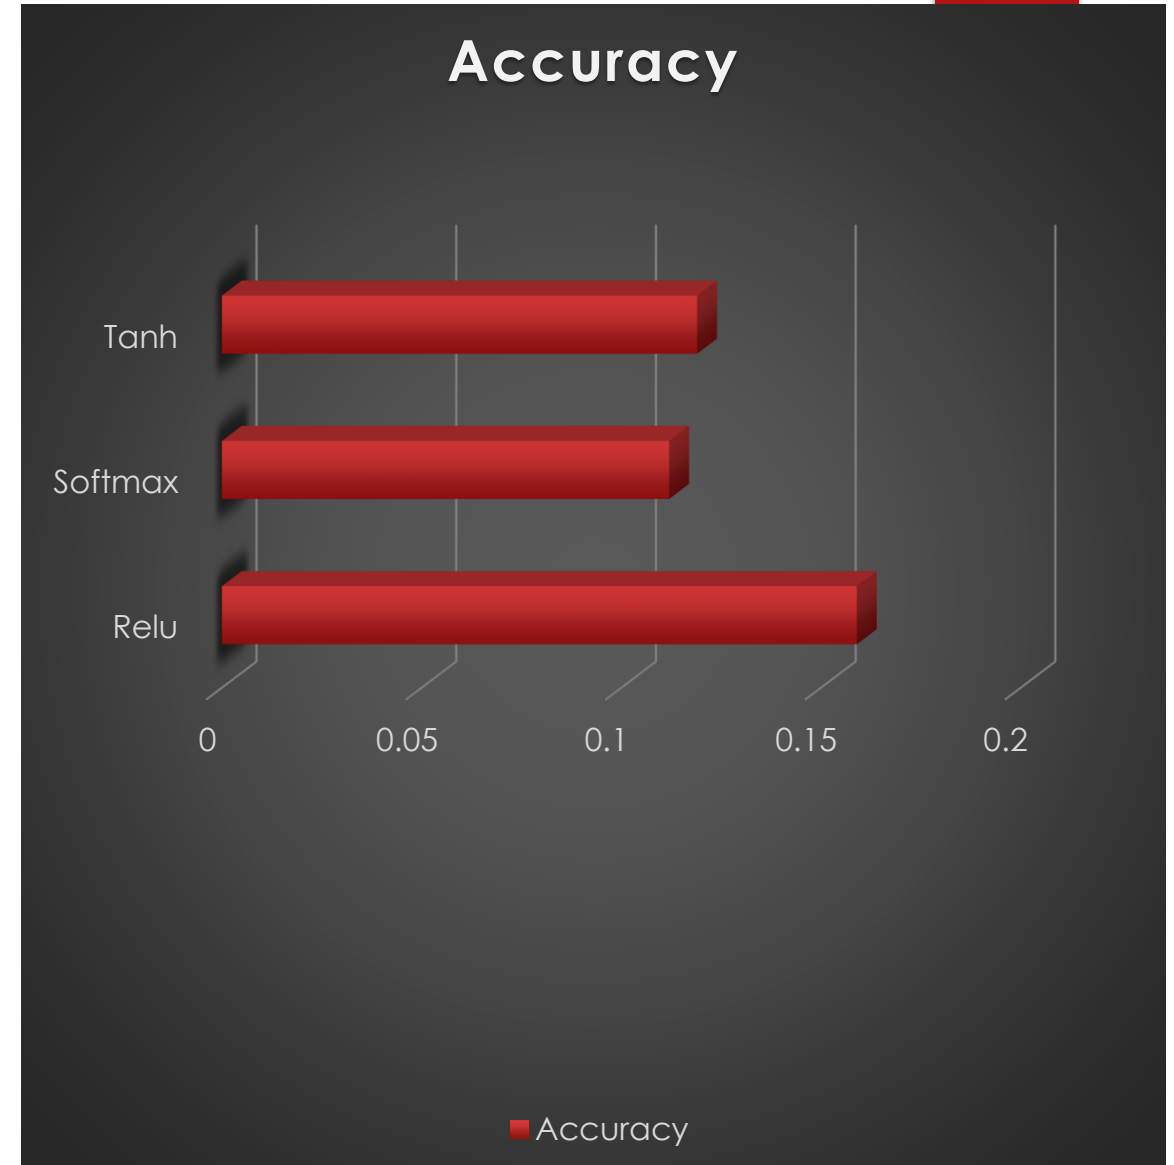

CNN

- ▶ Tuning type : manually
- ▶ Vectorization : neural word embeddings
- ▶ Hyper-parameters:
 - ▶ Dimension: 1D
 - ▶ Kernel Size = 3
 - ▶ Filters = 100
 - ▶ Neurons 64 and 1

CNN RESULTS

- ▶ 15 % of accuracy
- ▶ ReLU Activation function

Manually tuned Classifiers hyper-parameter and accuracies

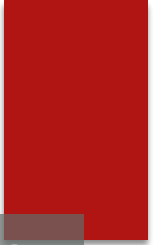

CLASSIFIERS	LAYERS	OPTIMIZERS	NEURONS	ACTIVATION FUNCTION	ACCURACY
FFNN	1,2,3	Adam	256	Softmax	28%
LSTM	1	rmsprop	64	Softmax	89%
BiLSTM	1	rmsprop	128	Softmax	91%
CNN	2	Adam	64 + 1	ReLU	15%

Automatic DNN Hyperparameter Optimization

Automatic Hyper-parameter tuning

- ▶ Tuned methods:
 - ▶ LSTM
 - ▶ BiLSTM
 - ▶ CNN
- ▶ Tested parameters and their values:
 - ▶ Activations: Sigmoid, Softmax, tanh, ReLU , Swish, SeLU
 - ▶ Optimizers: adam, sgd, rmsprop
 - ▶ Batch size: 32, 64, 128
 - ▶ Neurons : 16, 32, 64, 128
 - ▶ Layers: Up to 3 layers
- ▶ Tuning strategy:
 - ▶ *tpe.suggest* strategy
 - ▶ Optimization in 20 iterations

Method	Activation	Layers	Neurons	Batch_size	Optimizer	Accuracy
LSTM	Sigmoid	1	32	32	rmsprop	0.89
BiLSTM	Sigmoid	1	64	32	rmsprop	0.91
CNN	Sigmoid, Softmax	1	32	32	adam	0.61

Hyperparameter optimization result

DISCUSSION

- ▶ Previous work for Tigrinya POS tagging:
 - ▶ use the traditional methods of CRFs and SVMs.
 - ▶ 90% accuracy achieved by enriching contextual features with morphological and affix features.
 - ▶ DNN BiLSTM outperformed previous work with traditional machine learning approaches (Keleta et al., 2016) for Tigrinya language
- ▶ Results with DNN methods are above random and majority baselines.
- ▶ Tuning hyper-parameters automatically, achieved the best result using the BiLSTM, yet didn't beat the achievement of manually tuned hyper-parameter in BiLSTM model

DISCUSSION

- ▶ CNN model shows a good improvement using the automatically tuned hyper-parameters, which increases to 61% from 15%.
- ▶ FFNN performs poorly and is not suitable for the solving task.
- ▶ Working with small amount of data requires rule-based method and with NTC 1.0 more feature extraction is needed for better accuracy with other methods
- ▶ The McNemar test show that the difference between the best and the second achieved results are statistically significant

Conclusion and Future Work

- ▶ The best achieved accuracy = 91% for the Tigrinya POS tagging was achieved with BiLSTM method and neural word embeddings.
- ▶ The contribution of this research:
 - ▶ The first time state-of-the-art methods were applied for the Tigrinya language
 - ▶ Neural word embeddings have been trained and used for the first time for the Tigrinya language
 - ▶ The recommendations about the classifier and vectorization should be beneficial for the other Semitic languages (such as Tigre, Saho, Afar)
- ▶ Future work:
 - ▶ More data; more diverse data
 - ▶ Further NLP tasks that could not be initiated without POS tagger (e.g., dependency parsing)

Thank you
